

CIS 180 L - Intro to JavaScript - Fall 2006 Homework Assignment #6

Due: TUESDAY, September 12th, beginning of class

Purpose: To practice with JavaScript Array, String, Math, and Date objects.

Note: as long as you meet the specifications below, you may add additional embellishments as you wish.

How to turn this in: See instructions in #3 below - you will e-mail me the URL's for your completed pages.

1. Create a web page of your choice; in it, either **create** a new array, or **use** one of the **document** object's properties that happens to be an array. Display on your page the contents of that array.
2. Create a web page of your choice; ask the user for some string. Then display their string back to them in all-uppercase; and then do whatever additional thing(s) you wish with that string using at least one other String method, displaying that/those results to the screen as well.
3. Create a web page of your choice; in it, obtain the current date, and **DISPLAY** something about that date to the screen, using at least one Date method. (You could print the current day of the week with the help of a Date method and an array, or the current month, or the current time... your choice!)
4. Create a web page of your choice; in it, display the results of calling at least one Math method.
5. When your pages are ready, send me an e-mail to **sharon.tuttle@humboldt.edu** before the deadline with **CIS 180 JS HW 6** in the Subject: line containing the URL's for your four pages.
